Wednesday, April 02, 2008

Dear Madam or Sir:

This letter is to introduce the services provided by our company. Formula Scan gathers, publishes, compiles and analyses the latest patent publications, patents granted and invention disclosures in the fields of consumer products, pharmaceuticals and related industries.

Formula Scan recognizes that having rapid and up-to-date access to the latest technological advances is vital to the business of raw material producers, suppliers, distributors, formulators, inventors and market research specialists.

Formula Scan is the most comprehensive database of selected patent documents published in the world. Our data base includes more that 200,000 patent documents in the fields of skin care, hair care, skin care actives, cosmetics, home care, oral care, antiperspirants, pharmaceutical and related fields.

The technical information provided by Formula Scan is selectively obtained and well organized to meet the specific needs of our customers. The patent documents available at Formula Scan were selected from a myriad of patent documents available from the most important national patent data bases worldwide. Formula Scan uses the services of expert analysts to scan this information. Our patent analysts and consultants have years of experience working in industry as scientists, formulators or market specialists. They have a solid understanding of the most important technology trends affecting the consumer products and pharmaceutical industries. In addition, Formula Scan uses the services of experienced synthetic chemists capable of assessing the technology behind a newly patented formulation ingredient, polymer or active.

In addition, Formula Scan prepares highly specialized patent analysis reports and conducts custom patent data searches on request. The reports are methodically prepared by combining the expertise of our analysts and our proprietary data mining and indexing software. We provide these services to help our customers rapidly scan prior art, prepare their own invention disclosures, track technological activity in specific areas of interest, find solutions to complex technical issues and track competitive activity.

We cordially invite you to subscribe to our services. Please visit us at [www.formulascan.com](http://www.formulascan.com) to examine free samples of our work.

Respectfully yours,

Donna Ray  
Industry Relations Manager
